5 **METATHESIS OF FISCHER-TROPSCH PROCESS PRODUCTS TO
PRODUCE ALKYL BENZENES, DRILLING FLUIDS AND OXO-ALCOHOLS**

60142381 "070699
10 The invention provides alkyl benzene (AB), drilling fluid and oxo-
alcohols derived from metathesis of Fischer-Tropsch process products.

15 Conversion of lower olefins to higher olefins can be achieved by an
isomerizing metathesis process, or metathetic oligomerisation. Conventional
metathesis processes require an olefinic feedstock high in purity and linearity
and produce highly linear products.

20 Various heterogeneous contact catalysts such as $\text{Re}_2\text{O}_7/\text{Al}_2\text{O}_3$ and
 $\text{Re}_2\text{O}_7/\text{Al}_2\text{O}_3.\text{SiO}_2$, and also combinations of these catalysts with co-catalysts
can be used for metathesis of unfunctionalized olefins. However, other
catalyst and co-catalyst combinations, for example for homogeneous
metathesis using WCl_6 and/or ReCl_6 and a co-catalyst, have been used
successfully and the invention is not limited to any specific catalyst system,
nor to homogeneous or heterogeneous metathesis.

Surprisingly, and contrary to conventional thinking, it has now been found that by using metathesis on Fischer-Tropsch process products i.e. using Fischer-Tropsch feedstock to the metathesis process, which feedstock includes both branched and unbranched olefins, as well as non-olefinic components, specific hydrocarbons having between 8 and 18 carbons can be obtained, which hydrocarbons may be used to derive AB, oxo-alcohols and drilling fluid.

By a Fischer-Tropsch process product or feedstock is meant a product obtained by subjecting a synthesis gas including carbon monoxide and hydrogen, to Fischer-Tropsch reaction conditions in the presence of typically an iron based catalyst, a cobalt based catalyst, and iron/cobalt based catalyst, or any other Fischer-Tropsch catalyst, under Fischer-Tropsch reaction conditions.

This invention provides products in the 8 to 18 carbon range derived from 5 to 10 carbon Fischer-Tropsch process products, the products in the 8 to 18 carbon range having a desirable degree of branching or non-linearity.

Thus, according to a first aspect of the invention, there is provided an oxo-alcohol composition including oxo-alcohols having between 8 and 18 carbon atoms, the oxo-alcohols being derived from olefins obtained by metathesis of one or more of 5, 6, 7, 8, 9 and/or 10 carbon containing Fischer-Tropsch derived feedstock.

Between 10% and 90% of the oxo-alcohols of the composition may be branched oxo-alcohols.

5 The oxo-alcohols of the composition may be predominantly linear, with between 10% and 49% branched oxo-alcohols in the composition.

The composition includes between 15% and 35% branched oxo-alcohols.

10

The composition includes 24% branched oxo-alcohols.

The branching on the branched oxo-alcohols is predominantly mono-methyl branching, however, some di-methyl branching may also be present.

15

Typically, the mono-methyl branching will be in excess of 90% of the branching, or even in excess of 95%.

20 Typically, the oxo-alcohols of the composition in the 8 to 10 carbon range are usable as plasticizer alcohols.

Typically, the oxo-alcohols of the composition in the 10 to 16 carbon range are usable as detergent alcohols.

A typical product make up from the metathesis of a 7 carbon Fischer-Tropsch derived feedstock and suitable for deriving oxo-alcohols therefrom is set out in Table 1 at the end of the specification.

5 This product of Table 1 may typically be hydroformylated using a Co-EP catalyst, or any other suitable catalyst, to form predominantly linear alcohols, the ratio of linear to branched alcohols being related to the ratio of linear to branched product of the metathesis of the 7 carbon Fischer-Tropsch derived feedstock.

10

Thus, according to a second aspect of the invention, there is provided an alkyl benzene (AB) composition including AB having between 10 and 14 carbon atoms on the alkyl chain, the AB being derived from olefins obtained by metathesis of one or more of a 6,7 and/or 8 carbon containing Fischer-Tropsch derived feedstock.

15

The AB composition may contain between 10% and 90% of branched alkyl chain AB.

20

The AB composition may contain predominantly linear alkyl chain AB, with between 10% and 49% branched alkyl chain AB in the composition.

The composition includes between 15% and 35% branched alkyl chain AB.

The composition includes about 24% branched alkyl chain AB.

The branching on the branched alkyl chain of the AB is predominantly
5 mono-methyl branching, however, some di-methyl, ethyl, and /or propyl
branching may also be present.

Typically, the mono-methyl branching will be in excess of 90% of the
branching, or even in excess of 95%.

A typical AB product make up produced from the products of
metathesis of a 9 carbon Fischer-Tropsch derived feedstock is set out in
Table 3 at the end of the specification.

The AB may be sulfonated to give an alkyl benzene sulfonate which
15 may be used as a detergent. However, the AB composition itself may have
uses such as for drilling fluids.

The product of Table 3 was fractionated and a 10 to 14 carbon alkyl
20 chain AB fraction was obtained having the following composition (represented
as the linear internal olefin only):

Dec nes : 16.53%
Undecenes : 27.96%
Dodecenes : 26.19%
Tridecenes : 4.71%
3 Tetradecenes: 0.91%

Methyl branched internal olefins in the 10 to 14 carbon range make up most of the remainder.

60142331.070699
10 Thus, according to a third aspect of the invention, there is provided a drilling fluid composition including hydrocarbons having between 14 and 18 carbon atoms, the hydrocarbons being derived from olefins obtained by metathesis of one or more of a 8, 9 and/or 10 carbon containing Fischer-Tropsch derived feedstock.

15 The drilling fluid composition may include between 10% and 90% branched hydrocarbons.

20 The hydrocarbons of the drilling fluid composition may be predominantly linear, with between 10% and 49% branched hydrocarbons in the composition.

The composition includes between 15% and 35% branched hydrocarbons.

The composition includes about 24% branched hydrocarbons.

The branching on the branched hydrocarbons is predominantly mono-
5 methyl branching, however, some di-methyl, ethyl, and/or propyl branching
may also be present.

Typically, the mono-methyl branching will be in excess of 90% of the
branching, or even in excess of 95%.

A typical product make up from the metathesis of a 9 carbon Fischer-
Tropsch derived feedstock and suitable for deriving the drilling fluid
composition is set out in Table 2 at the end of the specification.

The product of Table 2 was fractionated and a 14 to 17 carbon fraction
was obtained having the following approximate composition (represented as
both methyl branched and linear internal olefins):

	Tetradecenes	:	23.03%
20	Pentadecenes	:	38.40%
	Hexadecenes	:	36.22%
	Heptadecene	:	2.35%
